Lab Course Machine Learning Exercise Sheet 8

Mofassir ul Islam Arif Information Systems and Machine Learning Lab University of Hildesheim

Submission deadline: Friday Jan 10, 23:59PM (on LearnWeb, course code: 3115)

Instructions

Please following these instructions for solving and submitting the exercise sheet.

- 1. You should submit two things a) python scripts(zipped) / jupyter notebook and b) a pdf document.
- 2. In the pdf document you will explain your approach (i.e. how you solved a given problem), and present your results in form of graphs and tables.
- 3. The submission should be made before the deadline, only through learnweb.
- 4. Unless explicitly mentioned, you are not allowed to use scikit, sklearn or any other library for solve any part. All implementations must be done yourself.

PyTorch in Research

In this lab, we will be revisiting the MCDCNN we built in the DDA Lab in SOSE2019. This offers us an apples to apples comparison between PyTorch and Tensorflow.

Research Paper Implementation (20 points)

Plagiarism: Submitting plagiarized work will not be tolerated in this lab by any means.

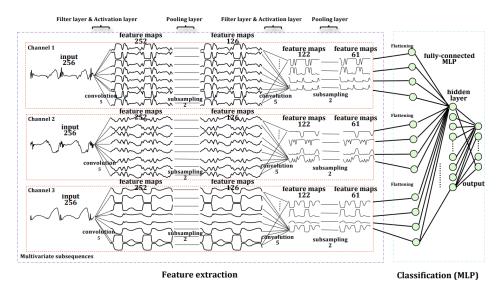

Figure 1: Architecture

Data: The paper talks about using the PAMPA2 dataset, you can find the dataset at http://archive.ics.uci.edu/ml/datasets/pamap2+physical+activity+monitoring. The authors have talked about their choice of a subset of the data and the preprocessing steps that they have applied. Treat the raw data in a similar manner. Please Show this both your report and the code.

• Implement the model as described by the authors using PyTorch.

- I highly recommend using the dataset and dataloader methods offered by PyTorch as they will make your code really streamlined
- If you have made ANY changes to the author's approach, mention it and state why you chose differently.
- Include tensorboards in your report. Include, gradient information, histograms, loss, and accuracies. [Tutorial can be found in Annex]
- You should be able to reproduce the results of the author.
- You are NOT allowed to use Keras for any purpose, using keras will not get your any credits.
- Present your results and compare them against the author's, if you have not been able to reproduce the results, investigate and report what caused this.

[NOTE: A lot of you used only 3 layers in the architecture last term. Please note that the authors used AS MANY CONV layers as the number of channels. Meaning each channel was passed through its own conv layers. The concatenation of the outputs of each channel is then passed to the MLP, as shown in the architecture diagarm. The figure you see is only an example where it is assumed that the data under consideration only has three channels. Your final architecture will have more than three channels.]

Bonus (5 Points)

```
_1 \text{ learn-nn-sgd}(\mathcal{D}^{\mathsf{train}} := \{(x_1, y_1), \dots, (x_N, y_N)\}, L, K, s, \nabla \mathcal{L}, \lambda, \eta, \textit{I}):

```

Figure 2: Algorithm, Neural Network

Algorithm shown here shows the manual implementation of the a Neural network.

- Implement the algorithm for a neural network with 2 Hidden layers and 4 neurons in each hidden layer.
- Generate moons dataset using sklearn and train your NN. The choice of parameters for the dataset are up to you. Use 2 classes.
- Compare your model with the same network implemented in PyTorch and comment of the difference you see. (speed, accuracy, loss)
